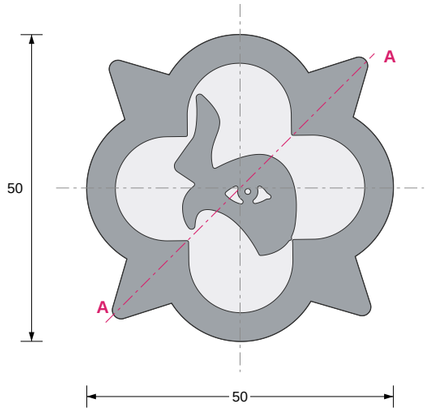
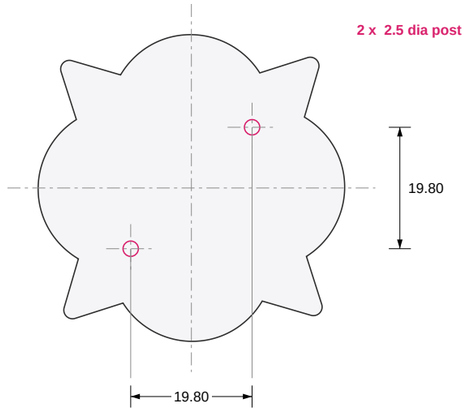
TraxNYC crest - domed button, riveted

50 mm across - face at 1:1 - all dimensions mm

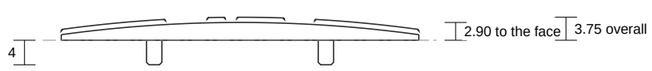
FACE 1:1 relief shaded



BACK 1:1 flat; post centres are the drilling pattern



SECTION A-A 1:1 on the diagonal through both posts



One piece. Cast or struck, then polished.
Face is a spherical cap, R 214, rising 2.00 at the centre over a 0.90 edge at the star tips and 1.44 at the cardinals. The blank is not round, so the edge is not one thickness.

Relief 0.85 above the face, top edge rolled R 0.25. It follows the cap, so the band stands the same height above the face at the rim as at the centre.

Tooling: nothing in the recess is narrower than 0.70 and no ridge is thinner than 0.50.
The drawing was opened with a disc of each size before the model was built, which is why the star points carry a small fillet and the eye reads as two corners and a dot rather than an iris.

2 posts, 2.5 dia x 4 long, 0.4 break on the free end, on the diagonal at r 14.
Drill 2.7 through the lid and rivet over, or supply with the posts plain for gluing.

Eagle head is an island on the face and is not joined to the band - the blank under it carries it.
