Trunk box · general arrangement

shut 170 x 70 x 55 mm · scale 1:2 · exterior only · all dimensions mm

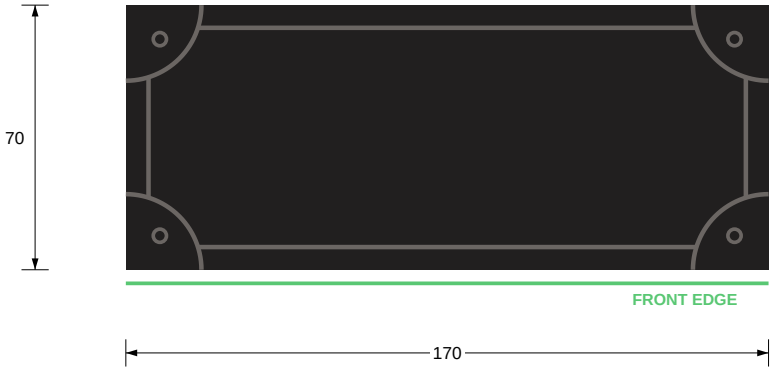

front · the lap hangs over the front wall

end · one panel, unbroken

lid top 170 x 70 · four caps, front edge at the bottom

Eight corner caps, one at each end of all four long folds.
The two front-bottom caps are mostly hidden: only the lowest 15 of each shows below the lap on a shut box. The lap's own free edge carries no cap.

Magnetic catch: pair at 40 centres, behind the lap's free edge, catching the front wall.

The lid overhangs the front by 5 · a 70 top over a 65 bottom · which is the front wall plus the lap.

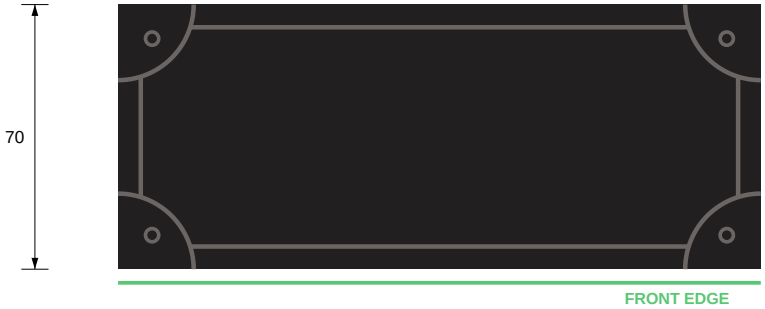

Trunk box · how it opens

the parts drawn apart · scale 1:2

1 · LAP · 170 x 40, hinged on the top's front edge. Lift it first · the catch is in its free edge. Shut, it leaves 15 of the front showing. The frame does not close at the bottom: the side lines run straight out.

2 · LID TOP · 170 x 70, hinged on the top/back fold. Swings back, and the lap folds back with it.

3 · FRONT WALL · 170 x 55, hinged on the bottom's front edge. Drops forward once the lap is clear. Open at the top, so its side lines carry on from the lap's.

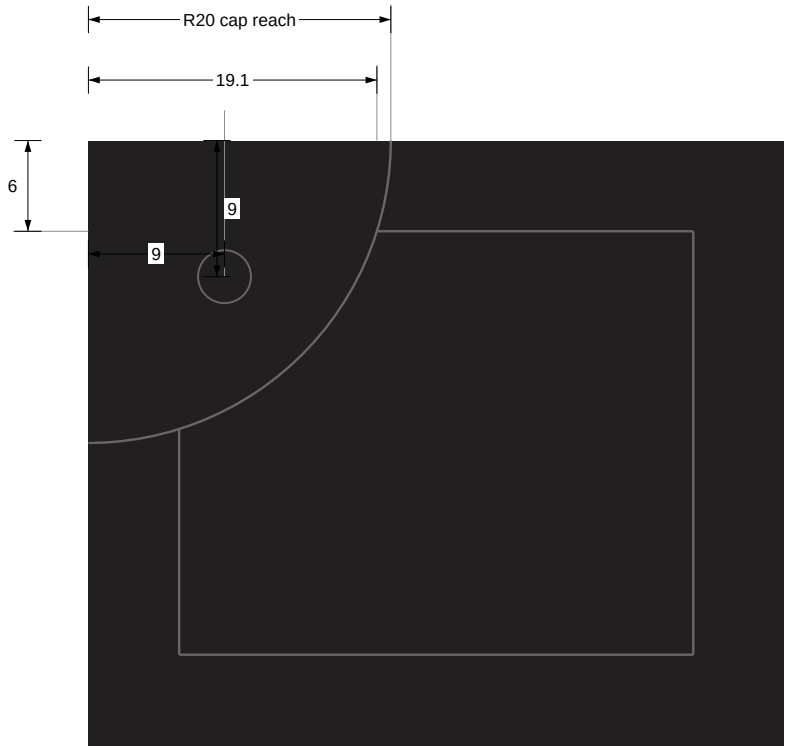

4 · BASE · bottom 170 x 65, back 170 x 55, two ends 65 x 55. Fixed.

Corner detail

scale 2:1 · the debossed line stops where the cap arc crosses it

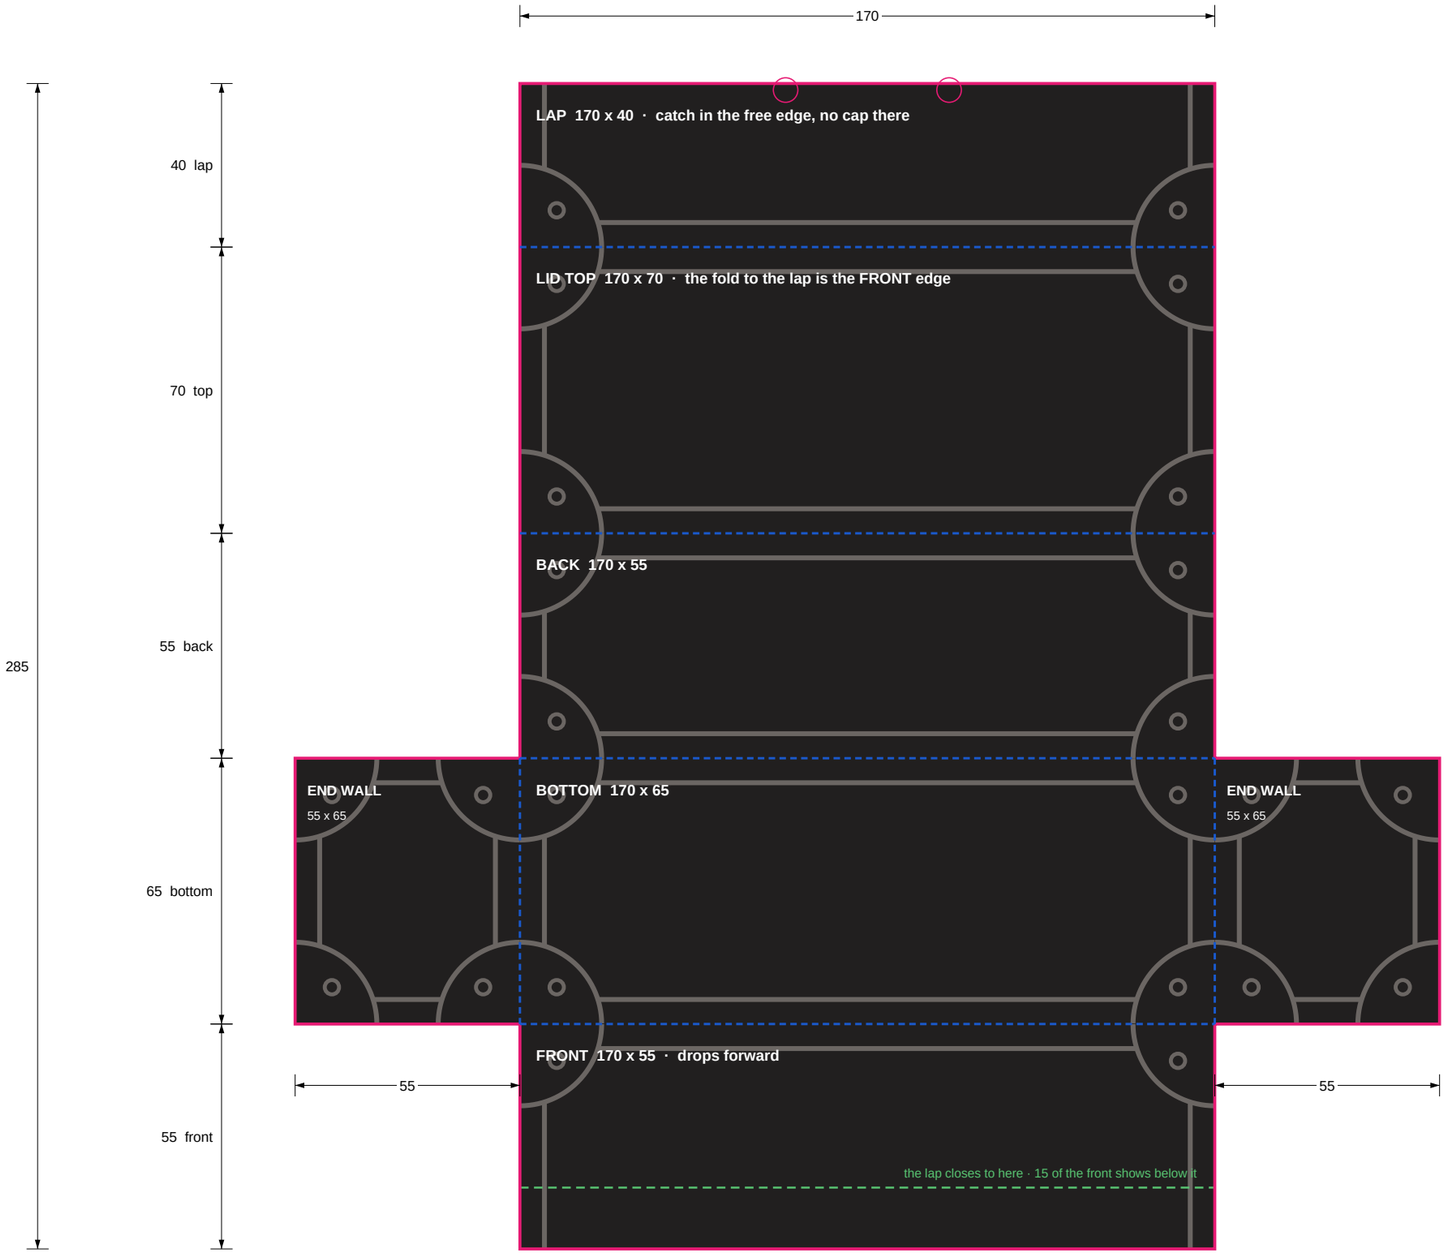

Cap: a quarter-round struck from the corner, worked in the wrap.
Radius 20. Domed stud 3.5 dia, centre 9 in from both edges.
Debossed line 6 in from the edge, 1.2 wide, blind · no colour.
The straight run ends at sqrt(20^2 - 6^2) = 19.1 from the corner, where the arc crosses it. The two marks meet; neither crosses.

A cap always sits on a fold, because it wraps a real edge of the finished box: eight corners, both ends of each of the four long folds. So the lap carries caps on the fold it shares with the top and none on its free edge, and the front wall carries caps on the fold it shares with the bottom and none on its top edge.

Nor does either frame close on that side. The two side runs carry straight out to the free edge, so a shut box shows one frame down the whole front instead of two frames meeting.

Trunk box · the net, printing and tooling

170 wide x 285 over five rows · scale 1:1.5 · magenta = cut · blue dashed = fold · grey = blind deboss

One piece. Lap down over the front, top over from the back, back and front up off the bottom, end walls up off the bottom row. The end walls butt the back and the front; no glue tab.

Every corner cap sits on a fold, because it wraps a real edge · eight corners, both ends of each of the four long folds.

The lap has no cap on its free edge and the front wall none on its top edge; those two meet each other, not a board edge. Neither frame closes there either: the side lines run straight out to the free edge, so the shut box shows one frame down the whole front.

Allow 15 turn-in on every raw edge, not drawn. Board 2.

Blind deboss 6 in from each panel edge, 1.2 wide, each run stopping 19.1 from the corner where the cap arc meets it.
